0.1 Omissions

The following were omitted from the tests due to convergence failures. ODE.jl's adaptivity is not able to stabilize its algorithms, while GeometricIntegratorsDiffEq has not upgraded to Julia 1.0. GeometricIntegrators.jl's methods used to be either fail to converge at comparable dts (or on some computers errors due to type conversions).

```
#sol = solve(prob,ode23s()); println("Total ODE.jl steps:  $(length(sol))")
#using GeometricIntegratorsDiffEq
#try
# sol = solve(prob,GIRadIIA3(),dt=1/10)
#catch e
# println(e)
#end
```

0.2 High Tolerances

This is the speed when you just want the answer.

0.2.2 Conclusion

At high tolerances, **Rosenbrock23** and **lsoda** hit the error estimates and are fast. At lower tolerances and normal user tolerances, **Rodas5** is extremely fast. When you get down to `reltol=1e-10` **radau** begins to become as efficient as **Rodas4**, and it continues to do well below that.

0.3 Appendix

These benchmarks are a part of the DiffEqBenchmarks.jl repository, found at: <https://github.com/JuliaDiffeq/DiffEqBenchmarks.jl>

To locally run this tutorial, do the following commands:

```
using DiffEqBenchmarks
DiffEqBenchmarks.weave_file("StiffODE","Hires.jmd")
